Top 13 Forex Entry Models

1. BOS + OB Pullback Entry

✦ Concept:

After a higher timeframe **Break of Structure (BOS)**, the market usually retraces to the **Order Block (OB)** that caused the impulse. This OB acts as a decision point.

🧠 Execution:

Wait for price to return to that OB, then drop to **LTF (1m–5m)** and enter only after a bullish/bearish **Change of Character (CHoCH)** or rejection wick.

🎯 **Target:** External liquidity (previous high/low)

2. Liquidity Sweep + CHoCH Entry

✦ Concept:

Price grabs liquidity above equal highs or below equal lows (trap zone), then reverses. It's where Smart Money hunts stop-losses.

🧠 Execution:

Once the sweep happens, wait for **LTF CHoCH** to confirm reversal. Entry is taken on retracement after the CHoCH.

🎯 **Target:** Internal structure or unmitigated OB

3. Breaker Block Entry (ICT Unicorn Model)

✦ Concept:

A fake BOS followed by a **real BOS** in the opposite direction. The zone where the fake BOS started becomes the **Breaker Block** — now used for re-entry.

🧠 Execution:

Enter when price revisits this breaker block with rejection confirmation.

🎯 **Target:** Opposite side liquidity or market imbalance

4. Fair Value Gap (FVG) Entry

✦ Concept:

An FVG (price imbalance) appears as a gap between candles during aggressive moves. Smart Money often

returns to fill this gap before continuing the move.

 Execution:

Wait for price to tap the FVG, then enter with a **wick rejection**, small-bodied candle, or **CHoCH** in LTF.

 Target: Trend continuation or swing high/low

5. Spring Entry (Wyckoff Accumulation - Phase C)

 Concept:

Price dips below support to trigger stop-losses (**Spring**), then reclaims the range — showing smart accumulation.

 Execution:

Enter after Spring is confirmed by a bullish candle, LPS (last point of support), or **CHoCH** in LTF.

 Target: Range highs or Phase E markup

6. Upthrust Entry (Wyckoff Distribution - Phase C)

 Concept:

Price breaks resistance to trap breakout buyers (**UTAD**), then reverses sharply — a sign of distribution.

 Execution:

Look for bearish **CHoCH** or breakdown after UTAD. Enter on retest.

 Target: Range lows or Phase E markdown

7. Reclaimed OB Entry

 Concept:

An OB gets broken, but then price **reclaims** it and respects it again. This shows institutional re-accumulation or redistribution.

 Execution:

Enter on retest of the reclaimed OB with LTF confirmation (e.g., rejection, **CHoCH**, or engulfing).

 Target: Next BOS or major swing point

8. OB + LTF CHoCH Entry

 Concept:

Blindly entering at an OB is risky. Wait for **confirmation** from the **lower timeframe** (**CHoCH**) inside the OB before entering.

Execution:

Once price enters HTF OB, drop to 1m–5m and look for a CHoCH. Enter on retracement.

 **Target:** Internal structure or continuation impulse

9. Volume Spike + Price Action Entry

Concept:

A volume spike often signals Smart Money entry. If it aligns with an OB, FVG, or CHoCH, it confirms strong intent.

Execution:

Enter on pullback to the OB or FVG that caused the volume spike, ideally when price prints a confirmation candle.

 **Target:** Liquidity grab zone or impulse follow-through

10. Trendline Liquidity Break + CHoCH Entry

Concept:

Trendlines attract retail entries. Smart Money often breaks these trendlines to collect liquidity, then reverses.

Execution:

After trendline break, wait for LTF CHoCH to confirm reversal. Enter on the next pullback.

 **Target:** Back to OB zone or new structural expansion

11. High Volume Rejection + Low Volume Confirmation Entry

Concept:

A strong rejection candle on high volume shows Smart Money rejection. If followed by a small low-volume candle, it signals no interest in continuing the previous move.

Execution:

Enter when the next candle confirms reversal. Ideal around OB, FVG, or Spring/UTAD zones.

 **Target:** Swing highs/lows or BOS level

12. No Demand / No Supply Candle Entry

Concept:

- **No Demand:** Green candle, small/medium range, **volume lower than last two candles** → signals weak buying interest
- **No Supply:** Red candle, small/medium range, **volume lower than last two candles** → signals weak selling pressure

Execution:

Wait for the next candle to confirm reversal. Best used inside OBs or after liquidity sweeps.

 **Target:** Next structure level or price imbalance

13. Sign of Strength (SOS) / Sign of Weakness (SOW) Entry

Concept:

- **SOS:** Wide bullish candle with high volume after Spring → smart money showing strength
- **SOW:** Wide bearish candle after UTAD → smart money unloading positions

Execution:

Enter after pullback to OB/FVG following SOS/SOW. Combine with CHoCH for extra confirmation.

 **Target:** Major markup/markdown expansion targets

14. RSI Divergence-Based Reversal Entry (Bonus Model)

Concept:

Divergence between **price structure** and **RSI** signals a **loss of momentum** — often hinting at trend exhaustion and a possible reversal. Ideal after a strong move when Smart Money is about to exit and trap late traders.

▼ **Bearish Divergence Setup**

- Price forms **Higher Highs**, but
- RSI forms **Lower Highs** (momentum weakening)
- Typically occurs **after an uptrend**, near **liquidity grab zones**, **UTADs**, or **premium OBs**

Execution:

1. Wait for price to make a new higher high (above previous swing high).
2. Confirm **RSI makes a lower high** at the same time.
3. Watch for a **bearish intent candle** (engulfing, rejection wick, CHoCH) on LTF.
4. Enter on next candle open or a small pullback.

 **Target:** Internal structure lows, FVGs, or swing low liquidity

 **SL:** Above the divergence high or UTAD

▲ **Bullish Divergence Setup**

- Price forms **Lower Lows**, but
- RSI forms **Higher Lows** (selling momentum fading)
- Typically occurs **after a downtrend**, near **Spring zones** or **demand OBs**

🧠 **Execution:**

1. Wait for price to sweep the previous low.
2. Check **RSI is forming a higher low**.
3. Look for **bullish candle confirmation** (engulfing, LPS, CHoCH).
4. Enter on the next bullish move.

🎯 **Target:** Range high, OB, or next BOS

📉 **SL:** Below the divergence low or Spring

✅ **Key Confluence Tips:**

- Best used near: **Order Blocks, Liquidity Sweeps, UTADs, Springs, Trendlines**
- Combine with: **Volume rejection + CHoCH** for maximum accuracy
- Works on all timeframes, but highly effective on **15m–4H**

📌 **Final Thought:**

“Divergence shows you what the candlesticks try to hide — a tired move with no fuel left.”
Perfect for sniper entries before reversals begin.
